

CREATE TABLE STUDENT...  
 CREATE INDEX STUDENTIDX ON STUDENT...  
 CREATE INDEX STUDENTSINX ON STUDENT...

# Indexes: Example

Typically, many rows (tuples) per data page

Sample row on that data page is:

ADAMS	KIM	APSC	44	123777111
-------	-----	------	----	-----------

① unique hash index on student ID

Student Table (Data)

③ non-unique clustering index on Dept (B+ tree)

② unique hash index on S.I.N.

"Clustered" means most of the data pages are physically ordered in the order of the clustering index (e.g., most of the cpsc students are together)

④ non-unique, non-clustering B+ tree index on last name
